

# Taiwan-Japan University Presidents' Forum

JACUIE 2025Jul16

## *Challenges of Universities in Japan and Taiwan in the Innovative Era*

|             |                |
|-------------|----------------|
| 10:30-10:35 | Introduction   |
| 10:35-11:00 | Keynote Speech |
| 11:00-11:10 | Q&A session    |

The last and largest opportunity for the revival of Japan's semiconductor industry.

**HIDEKI WAKABAYASHI**

**Distinguished Professor**

**Kumamoto University REISI**

[wakawaka@kumamoto-u.ac.jp](mailto:wakawaka@kumamoto-u.ac.jp)

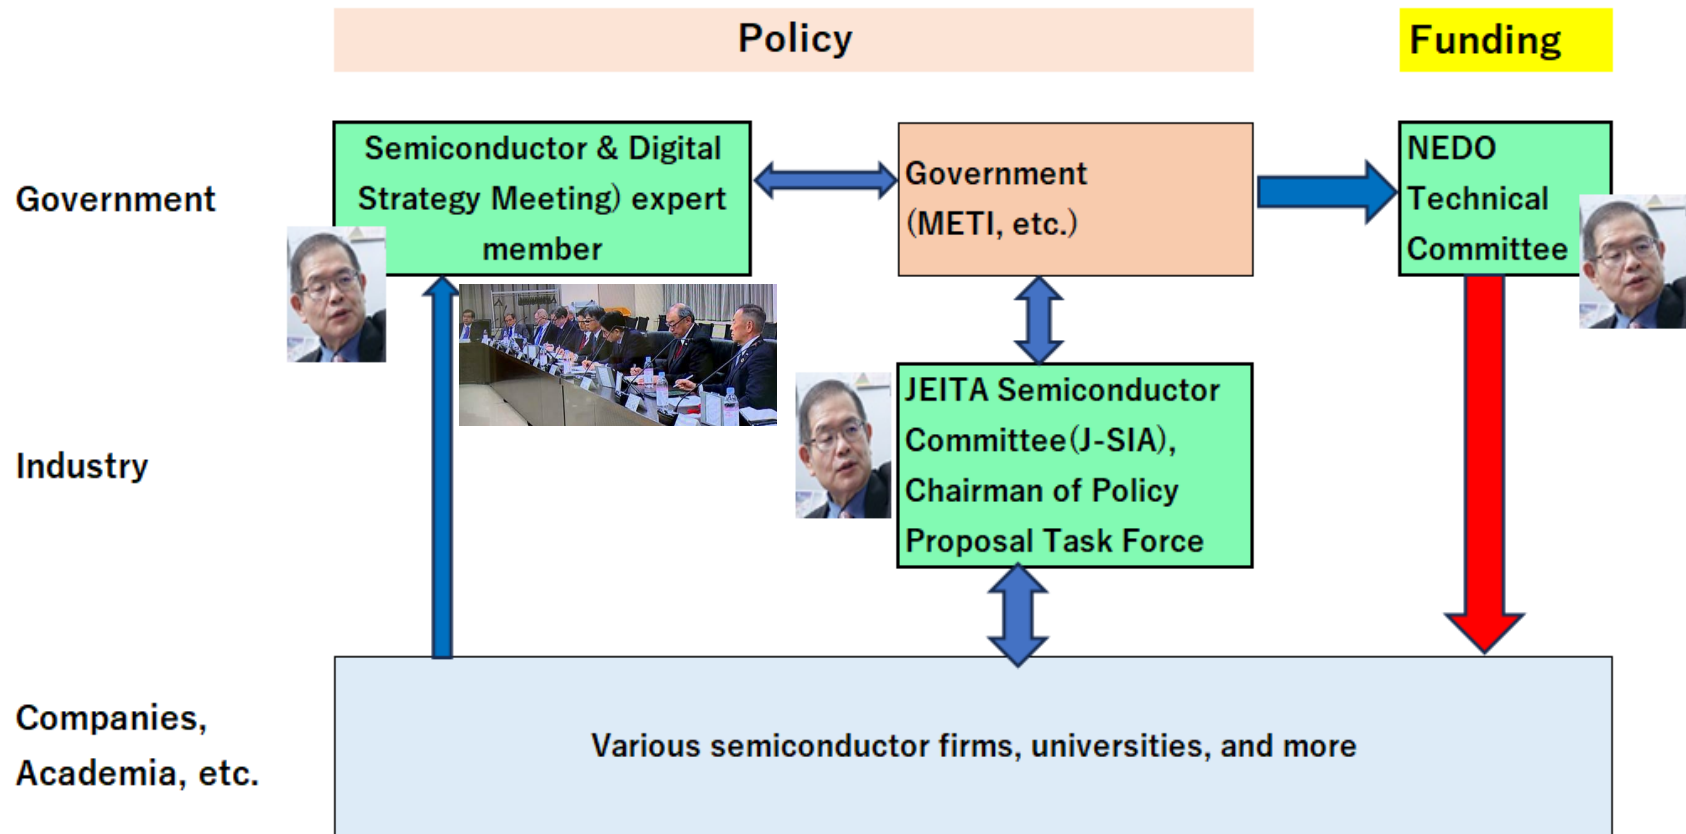

**Semiconductor and Digital Industry Strategy Study Group Expert Members**  
**JEITA Semiconductor Committee Policy Proposal Task Force Chairman**  
**NEDO Technical Review Committee Member.**

# My Role and Involvement in Semiconductor Policy

METI – Semiconductor and Digital Industry Strategy Review Meeting Over 20 regular members

NEDO Technical Committee member on the review board for the Post-5G Fund and GI Fund

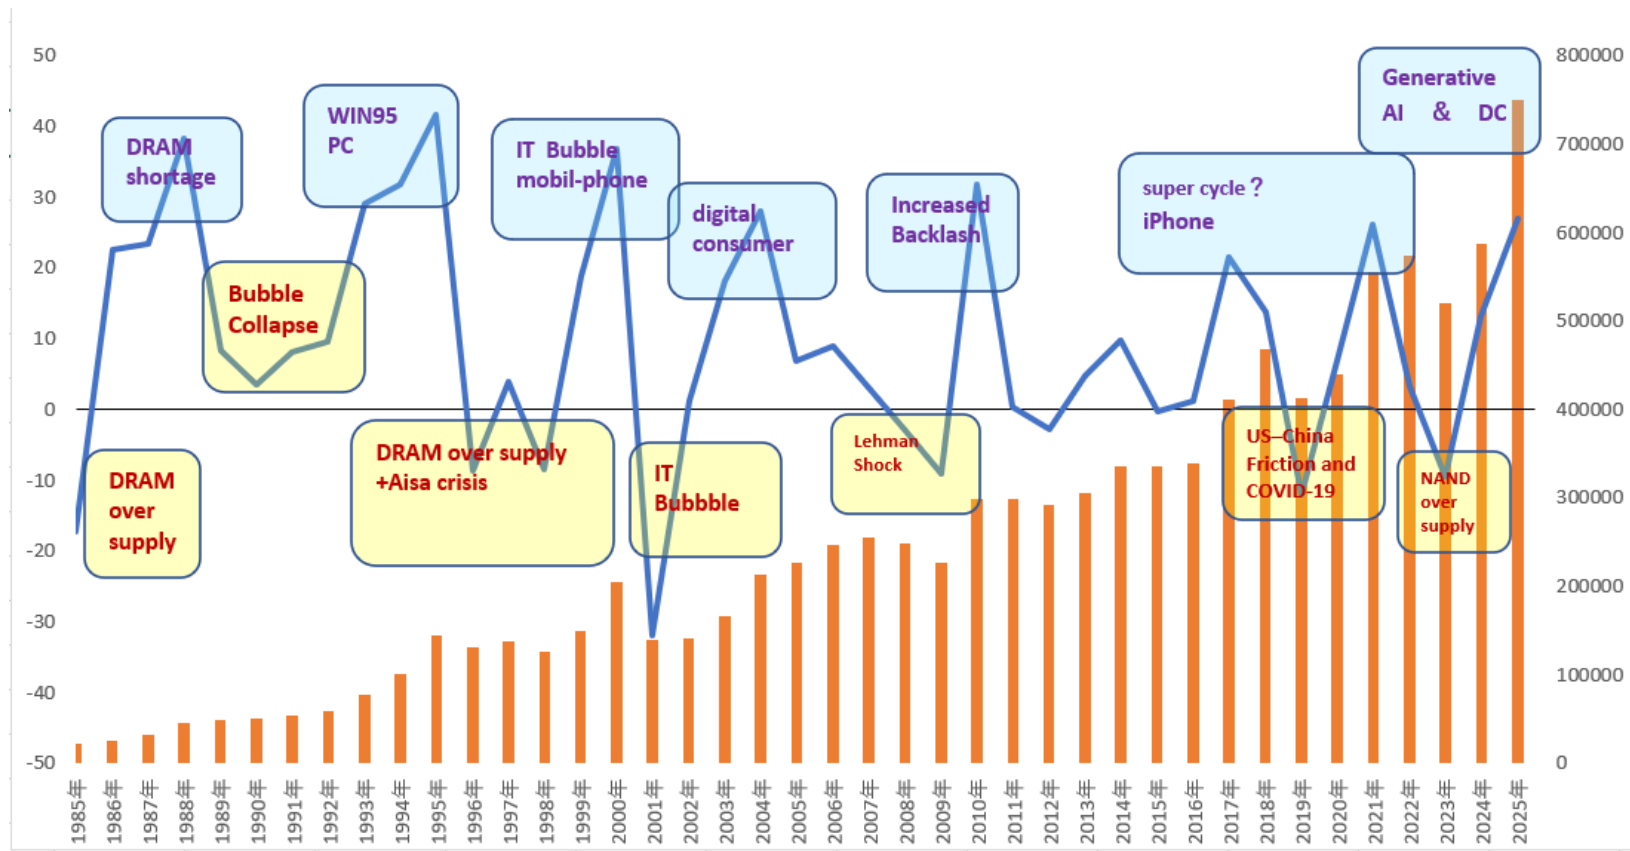

JEITA Semiconductor Committee(J-SIA) Chairman of the Policy Proposal Task Force

# Si-cycle

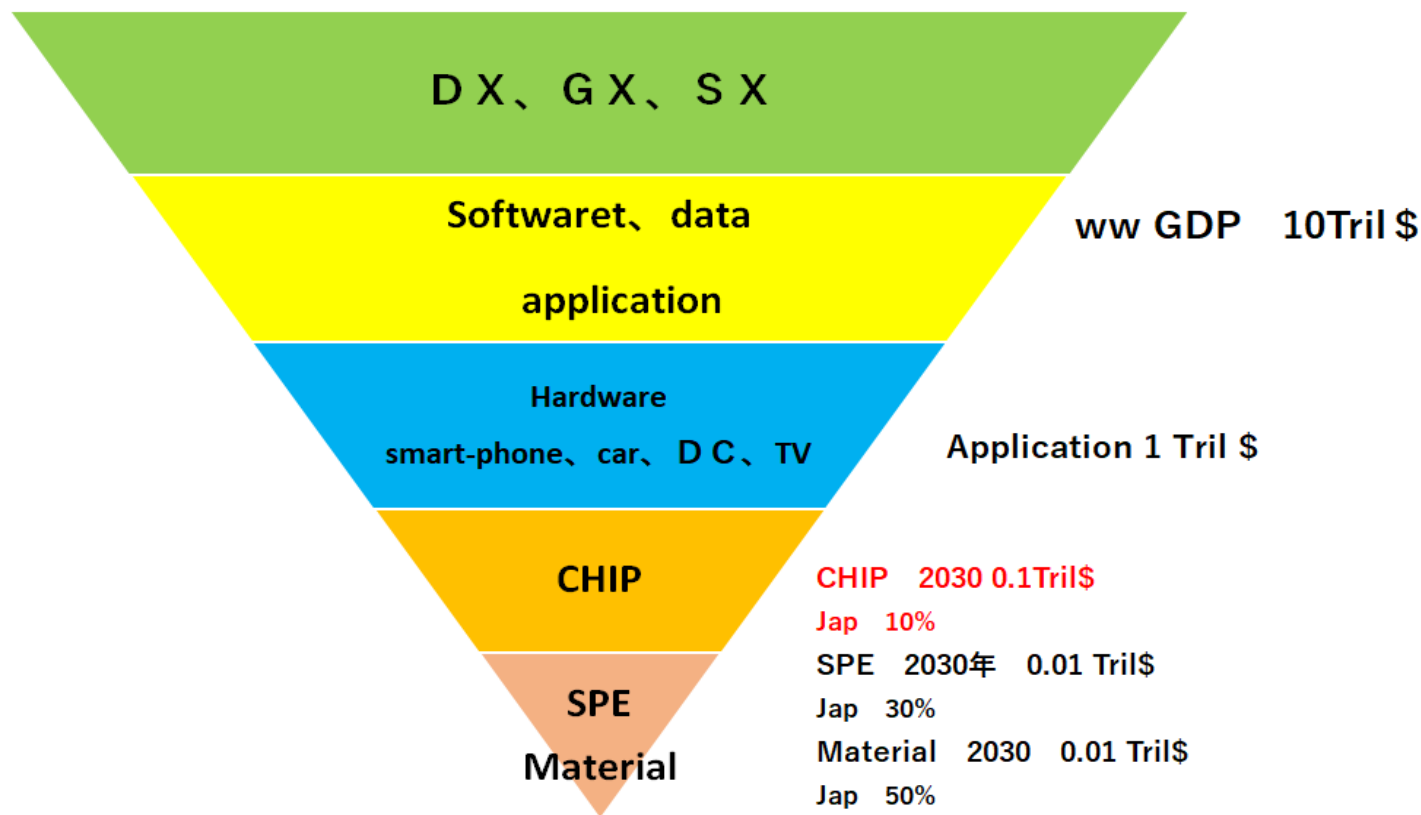

**Semiconductors: 1985–2025, growing within the silicon cycle.**  
**From 2024, they will experience significant expansion driven by generative AI and data centers**

Source: Hideki Wakabayashi

# Not all segments of the semiconductor industry have lost.

The weak ones are the advanced logic and fabless/foundry sectors that have failed to keep up, while sensors, NAND, analog, power, manufacturing equipment, and materials remain strong

# Technology is not just limited to fine processing on the "More Moore" axis!

## There are multiple axes of diverse development, such as 3D (package + stacking) on the "More than Moore" axis.

More than Moore (multiple axes)

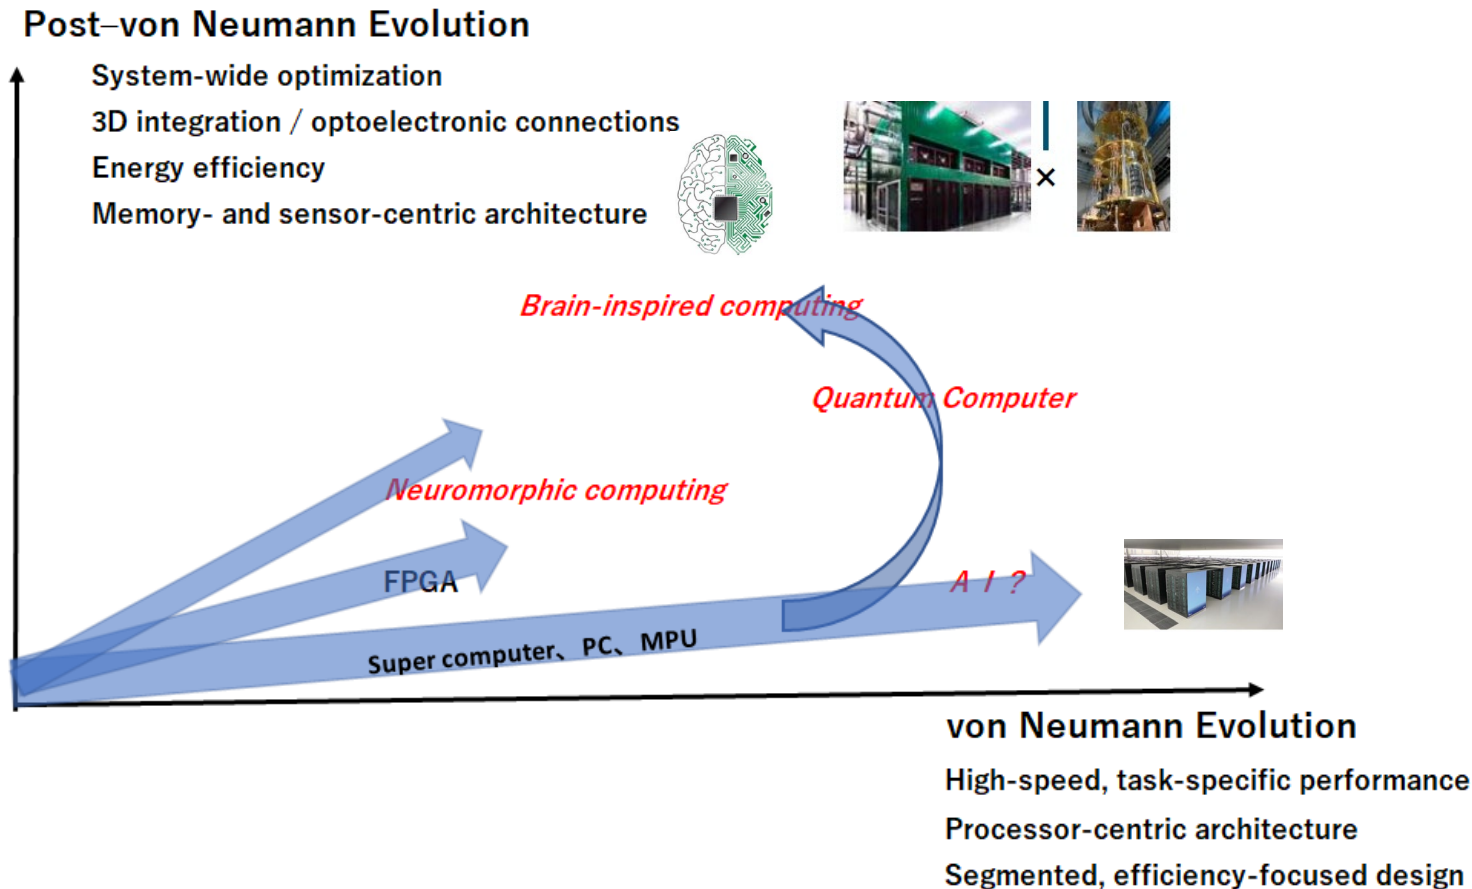

Source: Hideki Wakabayashi & METI

The long-standing von Neumann architecture is approaching its limits due to issues such as heat generation and the need for ever-increasing speed.

As a result, computing is shifting from a CPU-centric model to one centered around memory and sensors. Diverse non-von Neumann architectures—such as quantum computing and even brain-inspired models—are emerging and are likely to coexist in the future.

# A Once-in-a-Half-Century Opportunity Meeting U.S. Expectations

## The world's industrial structure encompasses

### Within the Four-Layer Industrial Structure, U.S. Expectations and Responses

- 1980s: High expectations for Japan, followed by subsequent disappointment
- After the 1990s: Japan's role was taken over by South Korea, Taiwan, and China
- *From 2020 onward: The United States may be disappointed in China*

While the spotlight in the semiconductor industry is often on front-end wafer processes, back-end operations—particularly OSAT—remain underdiscussed, despite their critical importance in the supply chain.

# J-OSAT

We established the Japan OSAT Federation, an industry association for semiconductor assembly and testing (OSAT) companies, on April 21, 2025, and officially registered it as a general incorporated association on May 2, 2025.

[一般社団法人日本OSAT連合会](#) | 半導体後工程産業のさらなる強化と発展を目指します

In the complementary relationship between Japan and Taiwan, Japan has strengths in materials and equipment, while Taiwan leads in fabless design, foundries, OSAT, and EMS. They also complement each other in memory and DAO. However, neither country has a strong presence in EDA.

|                    | EU | US | Jap | TW | korea | China |
|--------------------|----|----|-----|----|-------|-------|
| Material           | ○  | ○  | ◎ → |    |       | △ ?   |
| SPE(Wafer process) | △  | ○  | ○ → |    | △     | △ ?   |
| SPE(test assemble) | △  | △  | ○ → |    | △     | △     |
| EDA                |    | ◎  |     |    |       | △ ?   |
| IDM(Memory, DAO)   | ○  | △  | ○   | △  | ○     | △     |
| Fabless            |    | ◎  | △   | ○  |       | ○     |
| Foundary           |    | ○  | ← ◎ |    | △     | △     |
| OSAT/EMS           |    | △  | ← ◎ |    |       | △     |

There is a pressing need to cultivate a next-generation EDA industry tailored to the demands of the chiplet era

◎ Strong  
○ Mid  
△ Weak

# Evaluating regions geopolitically requires metrics like:

- ① Geostrategic Value (Latitude and longitude)
- ② Land area
- ③ Access to rare resources
- ④ Technological industrial clusters (SEMI, DC)
- ⑤ Economic ecosystems

|                                       | TW   | Okinawa | KyuSyu | Honsyu<br>+ Sikoku | Hokkaido |
|---------------------------------------|------|---------|--------|--------------------|----------|
| Economic value                        | Mid  | Low     | Mid    | High               | Low      |
| The value of technology SEMI, DC      | High | Low     | High   | High               | Low⇒High |
| The strategic value of rare resources | Low  | Low     | High   | High               | High     |
| The value of a country's land area    | Mid  | Low     | Mid    | High               | Mid      |
